The preparation of this book was supported by the OTKA under grant no. 100770.

The inspiring discussions with my students on the DEM courses are greatly acknowledged.

CONTENT

1. INTRODUCTION TO DEM 5
- 1.1 What is DEM? 5
- 1.2 The elements 6
- 1.3 The contacts 7
- 1.4 The initial geometrical arrangement 9
- 1.5 The main steps of discrete element modelling 12

2. THE EQUATIONS OF MOTION 14
- 2.1 Introductory remarks 14
- 2.2 Perfectly rigid elements 14
- 2.3 Elements made deformable by subdivision into finite elements 17
- 2.4 Deformable elements without subdivision 20
- 2.5 Time stepping versus quasi-static models 21

3. OVERVIEW OF NUMERICAL METHODS 24
- 3.1 Introductory remarks 24
- 3.2 The Newton-Raphson method 24
- 3.3 Relaxation: The Gauss-Seidel method 26
- 3.4 Solution methods for initial value problems 28

4. BALL-TYPE MODELS 36
- 4.1 Introduction 36
- 4.2 The elements 36
- 4.3 The contacts 37
- 4.4 The equations of motion and their time integration 40
- 4.5 Damping 42
- 4.6 Applications 43

5. UDEC 45
- 5.1 Introduction 45
- 5.2 UDEC: Two-dimensional modelling 45
- 5.3 3DEC: Three-dimensional modelling 52
- 5.4 Applications 54

6. QUASI-STATIC METHODS 56
6.1 Theoretical background 56
6.2 The most important quasi-static models 65
6.3 Applications 68

7. THE DDA MODEL 69
7.1 Introduction 69
7.2 The elements 69
7.3 The contacts 71
7.4 The equations of motion 72
7.5 Time integration: Analysis of a single time step 72
7.6 Applications 74

8. THE CONTACT DYNAMICS METHOD 77
8.1 Inroduction 77
8.2 The elements and the contacts 77
8.3 The equations of motion 81
8.4 The iterative solver 82
8.5 Applications 86

9. INTERPRETATION OF THE RESULTS I.:
GEOMETRY 87
9.1 Introductory remarks 87
9.2 Microstructural variables for the geometry 87
9.3 The material cell system and the space cell system 90

10. INTERPRETATION OF THE RESULTS II.:
STRESS AND STRAIN 95
10.1 Stress tensors 95
10.2 Strain tensors 98
